

# Exercise Session 8 IESM Fall 2023-2024

Andrea Levy, Andrej Antalik, Simon Dürr, Sophia Johnson

December 15, 2024

#### Course Reminders

#### Course Reminders:

- Exercises 8 and 9 will not have interviews and will have due date 31. January
- Plus, we only keep the best grades of 8 of 9 reports : )
- Feel free to contact us via email or forum for questions about Fx8 and Fx9 I

## Exercise 8 Finding transition states

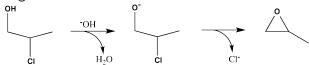

In this set of exercises, we will learn how to traverse the potential energy landscape in interesting directions toward transition states.

## Reaction Mechanisms & Stereochemistry

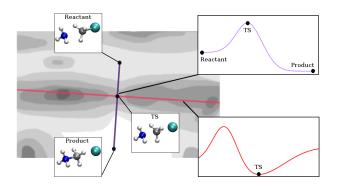

- The formation of propylene oxide takes place in a couple of steps
- Nucleophilic substitution occurs, binding O to C, and removing Cl- (leaving group)
- What is the name of such a mechanism and what is the orientation of O with respect to Cl as the ring begins to form?
- What might possible trnasition states look like as the ring begins to form?

Andrea Levy, Andrej Antalik, Simon Dürr, Sophia Johnson

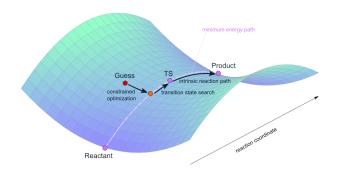

# Minimum Energy Path

 We need to find stationary points, for TS we need the Hessian with exactly one negative eigenvalue.

#### Intrinsic Reaction Path

#### Tips

- You do not need to run all notebooks! We provide some data to you (we are the "colleague" in this case) while writing out the code if you're interested.
- Read instructions carefully on how to generate a "guess" transition state
- Calculations may take time, please don't be alarmed!
- Notebooks are named Ex 9 based on past ordering, but this is Ex 8

Andrea Levy, Andrej Antalik, Simon Dürr, Sophia Johnson
